Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

-!- FUNCTION: Ice nucleation proteins enable bacteria to nucleate crystallization in supercooled water.

-:- SUBCELLULAR LOCATION: Outer membrane (By similarity).

-:- DOMAIN: CONTAINS MANY IMPEREET REPEATS OF THE CONSENSUS OCTABEPTIDE A AG-Y-G-S-T-X-T; FURTHER ON A 16-RESIDUE AND A REGIONAL 48-RESIDUE PERIODICITY IS SUPERIMPOSED.

-:- SIMILARITY: Belongs to the bacterial ice nucleation protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Pantoea ananas (Erwinia uredovora).

Biotechnol. Biochem. 58:762-764(1994).

-! FUNCTION: Ice nucleation proteins enable bacteria to nucleate crystallization in supercooled water.

-! SUBCELLULAR LOCATION: Outer membrane.

-! SUBCELLULAR LOCATION: Outer membrane.

-! DOMAIN: CONTAINS IMPERECT REPEATS OF A CONSENSUS OCTAPEPTIDE A-G-Y-G-S-T-X-T; FURTHER ON A 16-RESIDUE AND A REGIONAL 48-RESIDUE PERIODICITY IS SUPERIMPOSED.

-! MISCELLANGOUS: A STRUCTURAL MODEL IS SUGGESTED IN WHICH THE ICE NUCLEATION PROTEIN DISPLAYS A SYMMETRY RELATED TO THAT OF ICE.

-! SIMILARITY: Belongs to the bacterial ice nucleation protein

"The consensus sequence of ice nucleation proteins from Erwinia herbicola, pseudomonas fluorescens and Pseudomonas syringae.";
Gene 85:239-242(1989).
-! FUNCTION: Los nucleation proteins enable bacteria to nucleate
crystallization in supercooled water.
-! SUBCELLULAR LOCATION: Outer membrane.
-! SUBCELLULAR LOCATION: Outer membrane.
-! PRIODICITY IS SUPERIMPOSED.
-! PERIODICITY IS SUPERIMPOSED.
-! MISCELLANGOUS. A STRUCTURAL MOBEL IS SUGGESTED IN WHICH THE ICE
NUCLEATION PROTEIN DISPLAYS A SYMMETRY RELATED TO THAT OF ICE.
-! SIMILARITY: Belongs to the bacterial ice nucleation protein
                                                                                                                                                                                                                                                                                                                                                   27 GGGGNHNGGGNSSGPDSTLSIYQYGSANAALYDQLVTRVVTHEMAHAGYGNGADVGQGAD

The rickettsial outer membrane protein A and B genes of Rickettsia
australis, the most divergent rickettsia of the spotted fever group.",
Submitted (MAY-1999) to the EMEL/Genbank/DDBJ databases.
-I. FUNCTION: THE 120 kDa SURFACE-EXPOSED PROTEIN IS A MAJOR
STRUCTURAL PROTEIN WHICH MAY PLAY A ROLE AS A RICKETTSIAL
VIRULANCE FACTOR AND/OR IMMUNOGEN DURING INFECTION (By
similarity).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        (By similarity).
-!- SUBCELLULAR LOCATION: Cell wall. This bacterium is covered by a S-
layer with hexagonal symmetry (By similarity).
-!- SIMILARITY: BELONGS TO THE RICKETTSIAE OMPA/OMPB FAMILY.
                                                                                                                                                                                                                                                                                                           OMPB RICCN STANDARD; PRT; 1655 AA.

Recombinant agfA gene having a segment replaced by a foreign DNA sequence which encodes foreign epitope or antigen, expresses recombinant AgfA protein useful for eliciting immune response in animal.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present invention describes a recombinant agfh gene (I) where a segment of the gene has been replaced by a segment of a foreign DNA sequence which encodes a foreign epitope or antiqen. Also described are: (1) use of thin aggregative fimbriae (SEFI/TAF) nucleation depended assembly system of strains of Salmonella, Escherichia coli and Enterobacteriaceae for the production of fimbriae comprising recombinant AgfA, CsgA and AgfA-honologue fimbrin subunits, respectively; (2) directing recombinant gene into the chromosome of the homologous species; (3) directing recombination of a recombinant gene back into the chromosome of the homologous species, replacing the native
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Salmoneila; agfA; chromosomal gene replacement; fimbrin; epitope; vaccine; immune response; immunogen.

compy of that gene; and (4) eliciting an immune response in an animal, comprising separating an amino acid polymer comprising a recombinant Agfa protein containing a replacement segment or segments of foreign amino acid sequence or sequence segment on a Salmonella, E. coli or large acid sequence or sequences grown on a Salmonella, E. coli or but only the sequence of a conjunction with a carrier or diluent. (I) is useful for the expression of recombinant Agfa protein which is useful for eliciting an immune response in an animal. In a fimbrial presentation system the heterologous antigens are presented in high numbers (up to 500,000 copies/cell), the hybrid fimbrin protein possesses both the immunogens, which may be important for directing an immune response in mannogens, which may be important for directing an immune response against the inserted epitope, and hybrid fimbriae are easy and inexpensive to purify in large amount. The present sequence is given in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö

The present invention describes a recombinant agfA gene (1) where a segment of the gene has been replaced by a segment of a foreign DNA sequence which encodes a foreign epitope or antigen. Also described are: (1) use of thin aggregative finbriae (SEPI)/TARF) mucleation depended assembly system of strains of Salmonella, Escherichia coli and Enterobacteriaceae for the production of fimbriae comprising recombinant AgfA, cspA and AgfA, homologue fimbrin shunits. respectively, (2) directing recombination of a recombinant gene into the chromosome of the homologue species; (3) directing recombination of a recombinant gene back into the chromosome of the homologous species, replacing the native copy of that gene; and (4) eliciting an immune response in an animal, comprising separating an amino acid polymer comprising a recombinant AgfA protein containing a replacement segment of segments of foreign amino acid sequence or sequences grown on a Salmonella, E. coli or Enterobacteriaceae host cell, from the host cell and introducing the polymer into the animal in conjunction with a carrier or diluent. (I) is useful for the expression of recombinant AgfA protein which is useful for the expression of recombinant AgfA protein which is useful celliciting an immune response in an animal. In a fimbrial presentation system the heterologous antigens are presented in high numbers (up to 500,000 copies/Cell), the hybrid fimbrin protein possesses both the immunication properties relevant for an efficient live
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              7
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               113

```
assembly system of strains of Salmonella, Escherichia coli and assembly system of strains of Salmonella, Escherichia coli and Enterobacteriaceae (or the production of fimbriae comprising recombinant of Enterobacteriaceae (or the production of fimbriae comprising recombinant of a recombination of a recombinant gene into the chromosome of the homologous species, replacing the native compositions species, (3) directing recombination of a recombinant gene back into the chromosome of the homologous species, replacing the native copy of that gene; and (4) eliciting an immune response in an animal, comprising separating an amino acid polymer response in an animal, protein containing a replacement segment or segments of foreign amino acid sequence or sequences grown on a Salmonella, E. Coli or acid sequence or sequences grown on a Salmonella, E. Coli or acid sequence or sequences grown on a Salmonella, E. Coli or acid sequence or sequences grown on a salmonella, E. Coli or acid sequence or sequences grown on a salmonella, E. Coli or acid sequence of the confinent of the manual. In a fimbrial presentation system the heterologous antigens are presented in high numbers (up to 500,000 copies/cell), the hybrid fimbrin protein possesses both the immunogenicity and abhesion properties relevant for an efficient live vaccine, the carrier fimbrial submit proteins are usually strong immunogens, which may be important for directing an immune response in manual in expensive to purify in large amount. The present sequence is given in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    SDARKSETTITQSGYGNGADYDQLVTRVVTHEMAHAFRNNATIDQWNAKNSDITVGQYGG 120

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö
                                                                                                                                                                                                                                                                                                                                              The present sequence represents agfA encoded by the full agfA gene derived from Salmonsela enteritidis 27655-3b. The mucleic acid can be used to provide diagnostic associated Salmonella and/or enteropathogenic bacteria of the family Enterobacteria. It can also be used to provide proteins and antibodies which can be used for assays. The nucleic acid sequence can be used to provide probes or primers which can specifically hybridise to nucleic acid molecules from greater than 99% of Salmonella strains that are pathogenic to warm-blooded animals relative to nucleic 25-WAR-2003 to correct PF field.)

The present invention describes a recombinant agfA gene (I) where a segment of the gene has been replaced by a segment of a foreign DNA segment of the gene has been replaced by a segment of a foreign DNA consequence which encodes a foreign epitope or antigen. Also described are: (1) use of thin aggregative fimbriae (SEPI7/TAF) nucleation depended assembly system of strains of Salmontella, Escherichia coli and consequence to the production of fimbriae comprising recombinant of a recombinant gene into the chromosome of the composous species; (3) directing recombinant gene into the chromosome of the homologous species, replacing the native copy of that gene; and (4) eliciting an immune response in an animal, copy of that gene; and (4) eliciting an immune response in an animal. Comprising separating an amino acid polymer comprising separating an amino acid polymer comprising separating a replacement segment or segments of foreign amino acid sequence or sequences grown on a Salmonella, B. coli or Enterobacteriaceae host cell, from the host cell and introducing the correct constitution an immune response in an animal. In a fimbrial presentation system the heterologous antigens are presented in high numbers (up to copies/cell), the hybrid fimbrim protein possesses both the carrier fimbrial subunit proteins are usually strong munuogens, which may be important for directing an immune response in an animal in construction with a carrier fimbrial subunit proteins are usually strong immunogens, which may be important for directing an immune response community the hybrid fimbria are usually strong immunogens, which may be important for directing an immune response construction of the presented of immunogens in an immune response in an efficient live the animal may be important for directing an immune response consequence of immunogence is given in the horsely and abased and hybrid fimbriae are easy and interved epitemporation of the presented epitemporation of the presented epitemporation of the presented epitemporation of 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            -- FRNNATIDO 105
